# Public PR

kendall 10:51 AM

Good morning folks! This message comes to you from the **Common Components Team (CoCo)** - in our first two sprints we've been working to build a product we're calling the OpenShift Launchpad which is designed to accelerate new teams onboarding to the lab by giving them the ability to quickly spin up a new project that is deployable on OpenShift. We have a public PR open and would like to invite feedback from anyone interested. Please come see what we've been up to! 😊

<https://github.com/bcgov/openshift-launchpad/pull/30>

65 +   },
66 +   "resources": {
67 +     "limits": {
```

patricksimonian 8 days ago

+😊 ...

would like to see specific amount of build requests and a more fine tuned limit on cpu and memory. Has there been any measurement of how much resources are consumed during the client build?

wenzowski 2 days ago

+😊 ...

The process of tuning requests and limits itself is one I think we're looking for building competency in, beyond simply tuning this codebase. That is, we want new projects to learn how to be good shared-resource citizens, I think. Perhaps, to that end, we could put these oc templates in yaml format instead of json? That would allow us to have inline comments, like the salient @patricksimonian point above included directly. And this repo already has py so clearly the significant-whitespace tabs-vs-spaces point has already been provoked.

## CONTRIBUTION GUIDELINES

# Collaborating with Common Services Team

## How to Contribute

Government employees, the public, and members of the private sector are encouraged to contribute to the repository by forking and submitting a pull request.

(If you are new to GitHub, you might start with a [basic tutorial](#) and check out a more detailed guide to [pull requests](#).)

Pull requests will be evaluated by the repository guardians on a schedule and if deemed beneficial will be committed to the master branch.

All contributors retain the original copyright to their work, but by contributing to this project, you grant a world-wide, royalty-free, perpetual, irrevocable, non-exclusive, transferable license to all users under the terms of the license under which this project is distributed.

## Adding Frontend and Backend Boosters

All boosters must be contained in public GitHub repositories. They must also meet the following requirements.

- Must contain a `Dockerfile` in the project root directory
- A backend booster must expose its API on port 5000
- A frontend booster must expose its web app on port 3000
- Backend boosters must abide by the [Swagger definition](#)

Please ensure that all boosters are able to be run without any modification to the code using standard Docker commands. Cloning a booster, navigating to the project root directory, and running `docker build -t booster . && docker run -it booster` must result in a functional product. Further, all frontend boosters should be decoupled from backend boosters and vice versa.

Once the above requirements have been met, you may request that the booster be added to the OpenShift Launchpad. This may be requested in the following ways.

- Create a GitHub issue explaining the request and include the booster repository

## Contribution Guidelines

# Swagger

The screenshot shows the Swagger Editor interface with two main panes. The left pane displays the raw Swagger API specification in YAML format, while the right pane shows the generated API documentation.

**Swagger Editor:**

```

# Agile Manifesto

We are uncovering better ways of developing software by doing it and helping others do it.

Through this work we have come to value:

Individuals and interactions over processes and tools

Working software over comprehensive documentation

Customer collaboration over contract negotiation

Responding to change over following a plan

That is, while there is value in the items on the right, we value the items on the left more.
